Research Centre Partners

The group has established partnerships and collaborations with International and numerous national and local organizations/institutions/industries, schools and professional accrediting associations

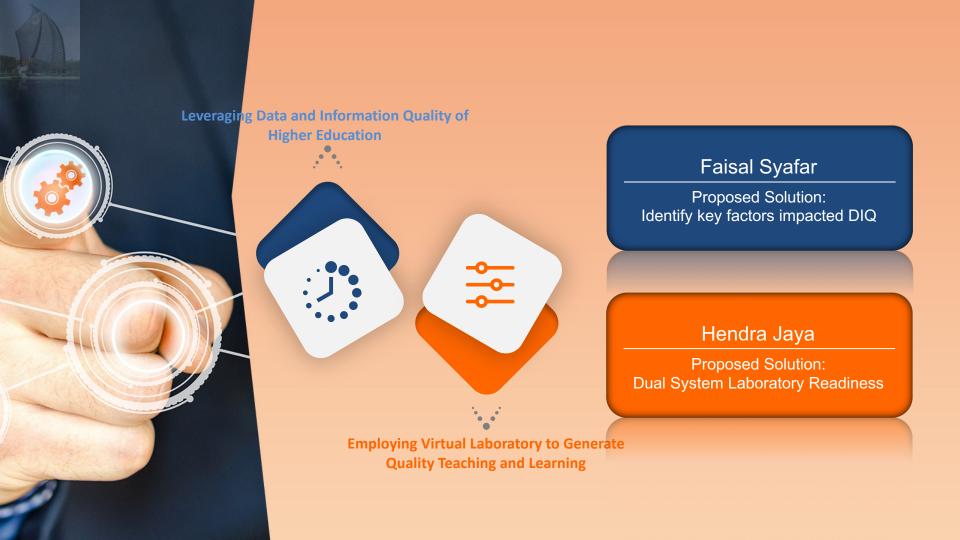

Current Research Projects (selected)

Mobile Learning Adoption by Indonesian University Students

E-Health Modeling Development: Expert System Based

Darlan Sidik

Proposed Solution: Explores Key Factors for Implementation

Yasser M. Djawad

Proposed Solution:
Augmenting Health Control/Referral Syst.

Mahmud Mustafa

Proposed Solution: Cultivate Modern Learning Process

Purnamawati

Proposed Solution: Boosting Students' Competence

Faisal Syafar

Proposed Solution:
Green IT & Software enhanced by
Mobile Technologies

Misita Anwar

Proposed Solution:
Contextualized STEM Learning

CIS RC

Past Research Projects

- Augmented reality for educational process
- Multimedia development
- Health information systems
- Framework development for implementation of mobile collaborative maintenance in large industry
- Medical electronics record
- Image processing
- Web based learning
- Real-time communication on uninhabited air borne vehicle
- Microwave and optical remote sensing of coastal vegetation
- Mobile telemedicine development
- Design of internet mobile network based wireless LAN cellular system
- Involving SMK students with disability in class mainstream

Saharuddin, Misita Anwar

Background

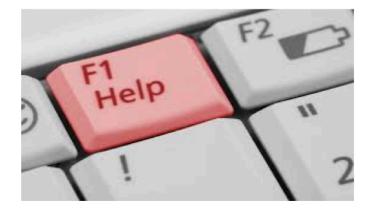

- Many teachers particularly those who work in rural areas - are struggling to access these professional development programs.
- programs are designed as face-to-face course located in a distant town or city.
- Distance learning modes are available but these are not feasible for those areas not covered by the internet infrastructure.

Towards developing ICT Technical support competency standard for high schools to enhance ICT integration in education

The government through the National Agency for Professional Certification (BNSP) encourages the higher education institution, professionals, professional organizations or industry places work to formulate National Work Competency Standards (SKKNI).

This research is aimed at to formulating ICT Technical support competency standard for high schools Indonesian Objectives to complement the standard.

ICT ADOPTION AND USE BY MICRO AND SMALL ENTERPRISE: A COMPARATIVE STUDY

Misita Anwar, Yasser Djawad

BUSINESS & IC

Access to ICT in some areas in Indonesia may be readily available, but due to lack of skills and insufficient knowledge, many people do not understand the advantages of using ICT for their business activities.

The LIAISE framework provides a structured format that could be applied to categorising the ICT needs of small business (Burgess, 2010).

Objectives

- To investigate ICT adoption and use by small business in Indonesia
- To propose an evolved LIAISE framework suitable for small business in developing context
- To identify best practices that can be applied by small business to assist them in the adoption decision and ICT use

Key Data and Information Quality Requirements for Asset Management in Higher Education

Faisal Syafar, Edy Sabara, Supriadi

Universities have millions of digital assets, thousands of users, hundreds of policies, many departments and stakeholders.

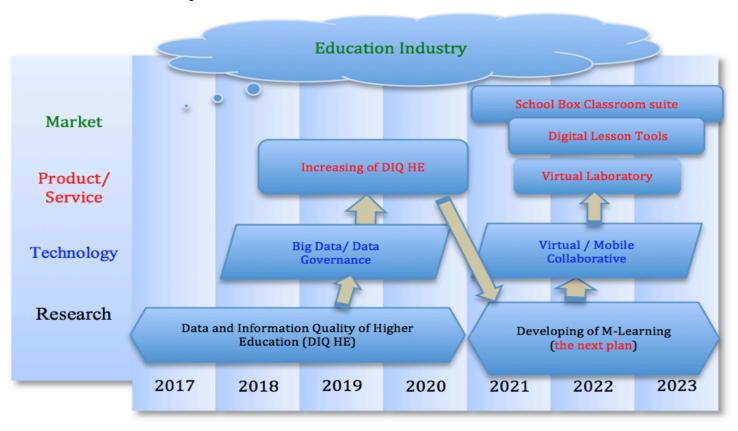

Asset management in Indonesian HE institution is not considered as a core business activity therefore they depend on the traditional organizational information sources to manage engineering assets.

In such an environment, knowledge on how to manage the quality of the information asset has become very crucial.

This research explores DIQ problems with existing HE's asset management system, and identifies key factors that impact on DIQ.

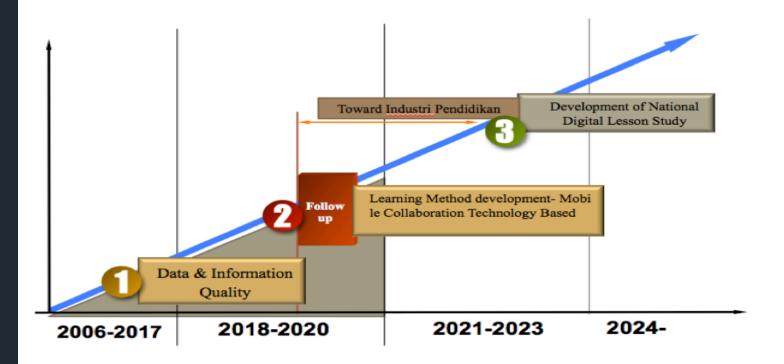

Road Map

Long Term Research Plan

Research Plan

Research in Progress (National Fund, selected)

Research in Progress (Global Collaboration and Funding)

- Systematic Sharing of Tacit Knowledge from Recordkeeping Perspective in Informal Setting: A Cross-Country Study on the Fisherfolk Community (Year 2 of 3) AU\$ 82,000 per year for Indonesia
- Cyber Security Capacity Building in ASIA-PACIFIC (Year 1 of 3) US\$ 180,000 per year for Indonesia
- Building a Scalable AI Supported Knowledge
 Management System and Smart Farming in West Papua (Year 1 of 3) AU\$ 124,000
- Monitoring and Assessment of acute respiratory infection, tuberculosis, and diarrhea (ATD) in Indonesian Remote Areas (Proposed) AU\$ 350,000 for 24 months

Design of Mobile Collaborative Data and Information Services for Indonesia Modern Outpatient

Drs. Faisal Syafar, M.Si., M.InfTech., Ph.D. Dr. dr. H. Leo Prawirodihardjo, Sp.OG (K), M.Kes. Misita Anwar, B.Eng., M.InfSc., Ph.D. Yasser Abd. Djawad, S.T., M.Sc., Ph.D.

Indonesian Hospitals delivers almost 5 million outpatient appointments every year. Patients attend outpatient

appointments for one of three broad reasons:

- an initial referral to acute care to get more specialist opinion and diagnosis;
- for treatment, which may be a series of treatments over time;
 or
- or follow-up to check on outcomes and/or continuing symptoms.

Key Facts

During 2015-16 there were a total of 4,500,280 outpatient attendances, of which 1,486,522 were new and 3,013,728 were return appointments.

Return appointments accounted for 67% of all acute outpatient activity

Key Facts

The dramatic increase in referrals to secondary care in a number of specialties is driven by increased disease prevalence, increased patient expectation and an increased range of treatments. A large number of referrals, however, do not result in any diagnosis being made (up to 30% in some specialties).

Not all referrals are made for diagnostic purposes, and not all referrals result in changes to care and treatment as a whole.

Offered Solution

We need to do more to support clinicians to manage risk appropriately and confidently, especially in the face of multi-morbidity. 'Realistic Medicine' can deliver change by reducing population 'health anxiety' and by fostering a culture which supports clinicians to have more informed conversation and decision making with patients.

Development of The Modern Outpatient model, which avoids the need for routine planned care by predicting risk, enabling self-management, providing support and intervention only when necessary, while maximizing the role of all clinicians across the healthcare system.

First

Designed to inspire a new model which reduces the need for routine face-to-face appointments by predicting risk, providing support only when intervention is necessary, whilst maximising the role of all clinicians across the healthcare system and delivering care in the community or in the patient's home whenever safe and practical to do so.

Research Objectives

Second

The Programme will support clinicians and other health and social care staff to develop robust approaches to deliver improvements in outpatient services to achieve the aims of the Programme. Working towards the transformational changes that are required will necessitate local clinical leadership and ownership. A number of healthcare systems worldwide have developed approaches that will be shared in order to support the Programme across Indonesia.

Road Map

Prevent unwarranted attendance/ admission/ referral as default for assessment, diagnosis and treatment Optimise what should be done inside hospital only be done inside hospital only Population which supports the extended MDTs to manage patients in the patient as default for assessment, diagnosis and treatment Consultation-led, hospital-based services which are predominantly face-to-face consultation and generate routine return appointments Consultation and generate routine return appointments Digital patient management/clinical decision support sthe extended MDTs to manage patients in the access to digital imaging software/virtual mediums/ service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care Pinnary care/Community service led care for non complex care for	1	Key Transformation Areas	Current State	Transformational Activities		Future State
Optimise what should be done inside hospital only Consultation-led, hospital-based services which are predominantly face-to-face consultation and generate routine return appointments Optimise what should be done inside hospital-based services which are predominantly face-to-face consultation and generate routine return appointments Patient self-scheduling tools/software and patient iTriage assessment which allows the patient to access care when required Planned return lists which ensures patients are seen at the right clinical interval by the right clinical interval by the right clinical interval by the right clinician Digital health technologies/wearable devices which enable	Р	attendance/ admission/	referral as default for assessment, diagnosis	clinical decision support applications which supports the extended MDTs to manage patients in the community Access to digital imaging software/virtual mediums/ diagnostics which enhance referral quality and primary care/secondary care dialogue E-advice feedback and advice only referrals which provides more timely access to		service led care for

		Prevent delay and create community capacity	Under-utilisation of extended multidisciplinary team skills, independent practitioners and community-based assets	wearable devices which enable		
				Condition specific pathways which triages patient to the right clinician first time and reduces unnecessary delays		Maximisation of the roles of the extended MDTs Pharmacy/Optometry/AHPs and other independent practitioners
create community extended multidisciplinary Condition specific pathways roles of the extended MDTs which triages patient to the practitioners and right clinician first time and and other independent				Training and e-learning which enables the wider MDT to support patients more holistically		

Collaborative Workflow Plan

Outpatients

- Patient appointment inquiry
- Pre-appointment patient reminder
- Current treatment schedule notification
- Missed appointment notification
- Past due patient payment notification service
- Pre-physical check-up and precaution procedure notification
- Inpatient wards waiting notification
- Pre-surgical operation notification
- Medication safety notification
- Pregnant women routine check-up notification
- Hospital adult check-up service notification
- Pap smear notification
- Pediatric disease vaccine service notification
- Abnormal test result from check-up/return to hospital for treatment service notification
- Lectures notification
- Hospital community activities notification
- Physician and patient relationship management
- Birthday greeting notification

Collaborative Workflow Plan

Physicians

- Notification of patient's abnormal lab result as well as other information to physicians
- Notification of drug safety issues regarding individual patients
- Group physicians notifications from Emergency room Physician's lateness and help notification

Administrators

The management of physicians and clinics

Topics Plan 2024-2029

- Cyber Security Capacity Building
- Traffic Management
- Smart Farming
- City Transport
- Noise, Air Quality control and Monitoring
- Inclusion of Student with disability in mainstream classroom
- Emergency Services
- Security and Safety
- Infrastructure Management
- Elderly-Care

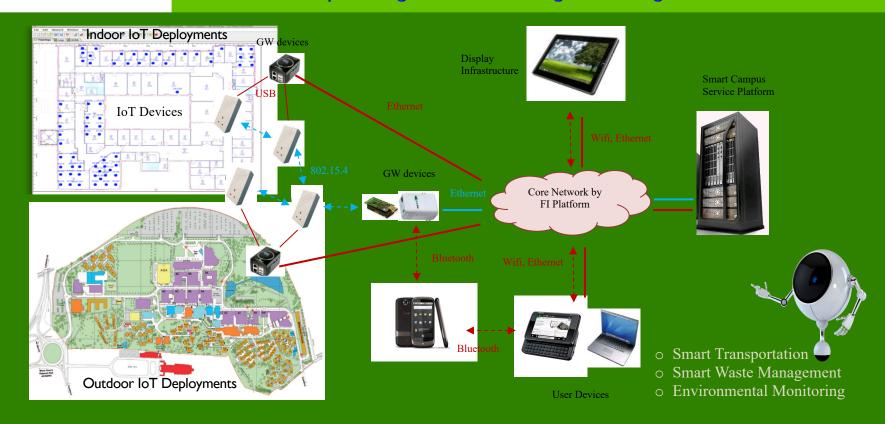

loT Applications in Smart City/Classroom/Campus

Application Requirements in IoT

- Smart Grid
 - Lower power consumption, location tracking, reliability and long maintenance cycles
- eHealth
 - Service reliability, mobility, lower power consumption, lower delays
- Automotive
 - Mobility, location tracking
- Smart cities
 - Reliability, fault tolerance, delay tolerance

Smart-Campus Infrastructure

Sustainable Campus using Internet of Things Technologies based LPWAN

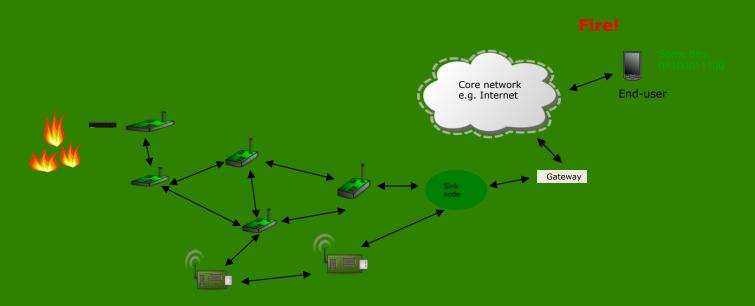

Conventional Network

Wireless Sensor Network-LPWAN
